Ne znam dal sam dobro shvatio, ali imam samo ove programe koji pocinju s 'ip':
ipcrm ipcs ipmaddr iptraf iptunnel

Mislim da ce uskoro 1 godina kako koristim web'n'walk. Znalo je zezat da se nece spojiti. Zadnjih tjedana me mucio MSN koji nece raditi, dok preko drugih providera oce. Sad mi ne radi nikako na kompjuteru :(

Zanimljivo je da na mobitelu (SE P910) radi i MSN.

```
TP# /etc/init.d/networking restart
Reconfiguring network interfaces...done.
```

```
TP# ping www.google.com
ping: unknown host www.google.com
```

Podignita su ppp0, eth0 (bez kabela) i lo sucelja
Kad spustim eth0 odmah kaze unknown host.

Dalje idem s restartanom mrežom, vezom i s podignitim ppp0, eth0 i lo.

```
TP# ping 10.12.0.1 #DNS providera, automatski ga dobijem PING 10.12.0.1 (10.12.0.1) 56(84)
bytes of data. --- 10.12.0.1 ping statistics --- 3 packets transmitted, 0 received, 100% packet loss,
time 2009ms TP# ping 87.252.137.243 PING 87.252.137.243 (87.252.137.243) 56(84) bytes of
data. --- 87.252.137.243 ping statistics --- 10 packets transmitted, 0 received, 100% packet loss,

PING 87.252.137.243 (87.252.137.243) 56(84) bytes of data. --- 87.252.137.243 ping statistics --- 5
packets transmitted, 0 received, 100% packet loss, time 4011ms
```

Meni kao nepoznavatelju mreže cini se da ono sto treba ic preko ppp0 nekako završi na eth0.
